<https://tn.gov/environment/section/na-natural-areas>

The development of this list has depended on the experience, expertise and dedication of the members of the Rare Plant Scientific Advisory Committee. Past State Botanists Claude Bailey, Carl Nordman, Milo Pyne and Dr. Paul Somers have also made exceptional contributions to this effort. The information used in compiling this list is the result of efforts by current and previous Tennessee Natural Heritage Program staff over the past 40 years.

INTRODUCTION

The mission of the Tennessee Division of Natural Areas (DNA) is to protect the state's plants, animals, and natural communities that represent the natural biological diversity of Tennessee. The DNA conducts a variety of programs and activities for accomplishing the conservation, restoration, and management of Tennessee's vast diversity of natural resources. One of the division's greatest values is the provision of technical assistance to public and private land managers. DNA provides this assistance through the Natural Heritage Inventory Program and this helps ensure that management decisions are made with knowledge of the significance and value of the natural resource. DNA carries out other aspects of its mission through the Natural Areas Program, Ginseng Program, and the Scenic Rivers Program.

The DNA began in 1974, with the assistance of The Nature Conservancy (TNC), and was known then as the Tennessee Natural Heritage Program. The purpose of the program was to provide science-based information on biodiversity to aid in selection of sites considered for the state's natural areas system. The number of rare species records grew and the scope of the program expanded to include environmental review processes.

The DNA relies on geographic information systems (GIS) databases to record and report important information regarding the state's rare plants, animals, and natural communities. The primary database (Biotics) was developed by NatureServe, the non-governmental parent organization of natural heritage programs. Natural heritage program staff direct and conduct field surveys for rare species and significant natural areas, as well as provide technical assistance regarding the distribution, conservation and management of Tennessee's biological diversity.

Information from the Biotics database helps accomplish the goals of conservation and protection of biological diversity. Federal, state, and private agencies, organizations, and individuals use rare species lists produced by the DNA for environmental review and land management decisions. Currently 535 rare plant species are tracked by the state, including 208 listed as state-endangered. DNA encourages individuals and organizations to assist staff biologists in determining accurate plant list contents and ranking information.

Since early in the 19th century, field botanists have been gathering valuable information about rare plants in Tennessee. Researchers have continued this important service up to the present day and the support of the scientific community is a key part of the process of monitoring rare plants in Tennessee. Without this support, the quality and completeness of the end product would be greatly diminished.

Plants listed at the federal level are protected by the Endangered Species Act (ESA) of 1973, as amended. The Fish and Wildlife Service (FWS) of the U.S. Department of the Interior administers the ESA and assigns federal status designations to species that are threatened with extinction. Twenty-three plant species in Tennessee are listed under the ESA.

Plants listed in Tennessee are protected by the Rare Plant Protection and Conservation Act of 1985. The Tennessee Rare Plant Scientific Advisory Committee consists of twelve botanists who are knowledgeable of the state's flora. This committee is required to meet at least once every three years in order to review the list and make recommendations to modify the list as needed. The criteria for listing a rare plant as endangered, threatened, or special concern, include but are not limited to the following:

- o Distribution of the species in Tennessee and throughout its range.
- o Number of populations in Tennessee and throughout the species' range.
- o Size of populations relative to estimates of minimal viable populations for the species.
- o Habitat specificity.
- o Known or perceived threats to the species and its habitats.
- o Number of protected populations.
- o Difficulty of adequately protecting or managing habitats for the species' survival.
- o Biological factors including the species' ability to reproduce, respond to disturbance, or its dependence on other species that may also be in jeopardy.

Any interested person may nominate a plant species for listing or recommend changes in status or removal of species from the current rare plant list promulgated under the act. Copies of The Rare Plant Protection and Conservation Act of 1985 (TCA §§70-8-301 – 314) and the associated rules (Chap. 0400-6-2) are available upon request.

(Adapted from Rules of Tennessee Division of Ecological Services, Chap 0400-6-2, Rare Plant Protection and Conservation Regulations.)

LIST STRUCTURE

The Rare Plant List is divided into **vascular plants**, **non-vascular plants**, and **fungi**. The vascular plants include ferns, fern-allies, conifers, and flowering plants (monocots and dicots). The rare non-vascular plants include mosses, liverworts, and hornworts. The **fungi** include two species of lichen. Plants are listed alphabetically by scientific name, and contain the following fields: scientific name, common name, physiographic provinces, habitat, phenology, state status, federal status, state rank, and global rank. The scientific name field includes a link to search for the species on the [NatureServe Explorer](#) website. The federal status includes a link to the US Fish and Wildlife service website.

Five plants threatened primarily by commercial harvest in Tennessee are listed as commercially exploited. These are American ginseng (*Panax quinquefolius*), goldenseal (*Hydrastis canadensis*), pink lady's-slipper (*Cypripedium acaule*), ramps (*Allium tricoccum*), and narrow-leaf ramps (*Allium burdickii*). The DNA does not recommend they be included in the normal environmental review process. Landowners and land managers should be aware that harvest of these plants, in many cases, is not sustainable.

Endemic plants are those naturally limited to a small geographic area and found nowhere else. Tennessee has a number of endemic vascular plants that do not naturally occur outside of the state. Rare vascular plants endemic to Tennessee are Pyne's ground-plum (*Astragalus bibullatus*), Harbison's hawthorn (*Crataegus harbisonii*), Tennessee coneflower (*Echinacea tennesseensis*), Ruth's golden-aster (*Pityopsis ruthii*), Stones River bladderpod (*Paysonia stonensis*), and Spring Creek bladderpod (*Paysonia perforata*). These plants are all

globally rare, and nearly all are federally listed under the Endangered Species Act. All occur in Tennessee's Central Basin, except for Ruth's golden-aster (*Pityopsis ruthii*), which occurs in the Blue Ridge. There are several other vascular plants endemic to Tennessee that are common enough in suitable habitat that they are not on the list of rare plants.

A number of plants are known to be extirpated from Tennessee. These plants were known from the state historically and all known populations have been destroyed, or for other reasons no longer exist. It is not likely that they will be rediscovered in Tennessee. These species are not on the list although some were previously listed. Should any of these species be rediscovered they would be recommended for listing. There are listed rare plant species known historically from Tennessee that might be rediscovered. These are noted as SH in the state rank field.

Scientific Name

A plant's scientific name may differ from other scientific names in use now or in the past. Standard references are followed, such as:

Flora of North America Editorial Committee, eds. 1993+. Flora of North America North of Mexico. 12+ vols. New York and Oxford.

Kartesz, J.T. 1999. A synonymized checklist and atlas with biological attributes for the vascular flora of the United States, Canada, and Greenland. First edition. In: Kartesz, J.T., and C.A. Meacham. Synthesis of the North American Flora, Version 1.0. North Carolina Botanical Garden, Chapel Hill, N.C.

Chester, E.W., B. Eugene Wofford, Dwayne Estes, Claude Bailey. 2009. A Fifth Checklist of Tennessee Vascular Plants. Sida Botanical Miscellany No. 31, Botanical Research Institute of Texas, Fort Worth. 102 pp.

Common Name

Common names are used for convenience and are often different among the regions of the state. For clarity, use scientific names whenever possible.

Physiographic Provinces

Physiographic provinces are provided based upon information from the division's Biotics database. For some rare plants on the list we have yet to receive data on specific locations, and these species have an incomplete listing of physiographic provinces. For more information on these species refer to county distribution maps online at the [University of Tennessee Herbarium](http://www.utah.edu/herbarium) website.

Abbreviations for physiographic provinces are as follows:

BR - Blue Ridge Mountains	SV - Sequatchie Valley
CB - Central Basin	WR - Western Highland Rim
CM - Cumberland Mountains	MF - Mississippi Floodplain
CP - Coastal Plain	WU - Western Uplands
CU - Cumberland Plateau	RV - Ridge and Valley
ER - Eastern Highland Rim	

Habitat

A brief description of the habitat for each species, in Tennessee, is provided. This information is based upon a variety of sources including field observations, literature sources, botanical manuals, and NatureServe. More complete habitat listings for each species can be found on the [NatureServe Explorer](http://www.natureserve.com) website.

Phenology

The best time to accurately identify a plant species in the field is when it is in a reproductive state (flowering, fruiting, or producing spores). The flowering and fruiting times are provided for the seed plants, and sporulation times are provided for ferns and fern allies. For some rare plants, vegetation alone is not enough for positive identification. This information is provided to facilitate efficient field surveys for Tennessee's rare plants. Phenology information should be used as a guide for scheduling fieldwork. These times vary from year to year and seasonal variations should be noted when undertaking surveys.

State Status

State status indicates which plants are formally listed as state **endangered**, **threatened**, or **special concern** under the authority of the **Tennessee Department of Environment and Conservation**. The state status is determined by the Tennessee Rare Plant Scientific Advisory Committee using the criteria listed previously. Changes to the **endangered** list must be effected through a rulemaking procedure. Status changes which the committee has proposed are indicated with a **P** preceding the status code. These will be included in the next update of the official rule.

- E**- **Endangered species** means any species or subspecies of plant whose continued existence as a viable component of the state's flora is determined by the commissioner [of the Department of Environment and Conservation or his/her authorized representatives] to be in jeopardy, including but not limited to all species of plants determined to be "endangered species" pursuant to the Endangered Species Act.
- T**- **Threatened species** means any species or subspecies of plant which appears likely, within the foreseeable future, to become endangered throughout all or a significant portion of its range in Tennessee, including but not limited to all species of plants determined to be a "threatened species" pursuant to the Endangered Species Act.
- S**- **Special concern species** means any species or subspecies of plant that is uncommon in Tennessee, or has unique or highly specific habitat requirements or scientific value and therefore requires careful monitoring of its status.

State status modifiers follow state status abbreviations.

P- **Possibly extirpated** is applied to a species or subspecies that has not been seen in Tennessee for the past 20 years. It is possible that it may no longer occur in Tennessee.

CE- **Commercially exploited** is applied to plants that are being taken from the wild in large numbers and propagation or cultivation is insufficient to meet market demand. These plants are of long-term conservation concern but the division does not recommend they be included in the normal environmental review process.

(Adapted from Somers, Paul. 1989. Revised List of the Rare Plants of Tennessee. *Journal of the Tennessee Academy of Sciences*, 64(3): 179-184., and Rules of Tennessee Division of Ecological Services, Chap. 0400-6-2, Rare Plant Protection and Conservation Regulations.)

Federal Status

Federally listed species are protected by the Endangered Species Act of 1973 (as amended). The list is administered and determined by the US Fish and Wildlife Service. Where these codes appear in the list, a hyperlink to the USFWS species profile is provided.

LE– **Listed endangered**, denotes a taxon that is threatened by extinction throughout all or a significant portion of its range.

LT– **Listed threatened**, denotes a taxon that is likely to become endangered in the foreseeable future.

PE– **Proposed endangered**, denotes a taxon that is proposed for listing as endangered.

PT– **Proposed threatened**, denotes a taxon that is proposed for listing as threatened.

C – **Candidate species**, denotes a taxon for which current information indicates the probable appropriateness of listing as Endangered or Threatened and that has been published in the Federal Register as a candidate for listing under the Federal Endangered Species Act.

DM– **Delisted taxon**, recovered, being monitored for first five years.

(Modified From Federal Register, 50 CFR Part 17, Feb. 28, 1996, Vol. 61, No. 40, pp. 7596 - 7613.)

Note: The taxa listed as candidate species may be added to the list of endangered and threatened plants and animals. They should be given consideration in environmental planning. Taxa listed as LE, LT, PE and PT must be given consideration in environmental planning involving federal funds, lands, or permits, and should be given consideration in all non-federal activities. For further information contact the Region 4, Endangered Species Coordinator, at the US Fish and Wildlife Service, 1875 Century Boulevard, Atlanta, Georgia 30345, phone (404) 679-7132; or an Endangered Species Specialist at the US Fish and Wildlife Service, 446 Neal Street, Cookeville, Tennessee 38501, phone (931) 528-6481.

State Rank

The state rank is a numeric rating (S1 through S5) of relative rarity based primarily on the number of occurrences of the plant in the state. The state and global ranks are non-legal ranks and only indicate the rarity of a species. Other factors in addition to the number of occurrences are considered when assigning rank, so the number of occurrences suggested for each numeric rank below is not a hard and fast rule.

S1– Extremely rare and critically imperiled in the state with five or fewer occurrences, or very few remaining individuals, or because of some special condition where the species is particularly vulnerable to extirpation from Tennessee.

S2– Very rare and imperiled within the state, six to twenty occurrences and less than 3,000 individuals, or few remaining individuals, or because of some factor(s) making it vulnerable to extirpation from Tennessee.

S3– Rare and uncommon in the state, from 21 to 100 occurrences.

S4– Widespread, abundant, and apparently secure within the state, though it may be quite rare in parts of its range, especially at the periphery, and is of long-term concern.

SH– Of historical occurrence in Tennessee, i.e., known to occur in Tennessee in the past, with the expectation that it may be rediscovered.

SU– Possibly in peril in Tennessee but status uncertain, need more information.

SX– Believed to be extirpated from Tennessee, with virtually no likelihood that it will be rediscovered.

S#S#– Denotes a range of ranks because the exact rarity of the element is uncertain (e.g., S1S2)

S?– Unranked within the state.

Note: The **Division of Natural Areas (DNA)** has responsibility for assigning state ranks. All listed species should be given some consideration in environmental planning but those species having a **State Rank of S1 to S3, state endemics**, and species with a **limited distribution** in Tennessee should be given special consideration. For further information contact **DNA** at (615) 532-0431.

Global Rank

Global ranks are determined by the scientific staff of NatureServe, the non-governmental organization of national, state and provincial heritage programs. Global ranks provide the best available and objective assessment of a rare plant's rarity and the level of threat to its existence. The total number of individuals, the number of populations, and the threats to the populations are considered throughout the plant's range.

G1– Extremely rare and critically imperiled, generally with five or fewer occurrences in the world, or very few remaining individuals, or because of some special condition the species is particularly vulnerable to extinction.

G2– Very rare and imperiled, generally with six to twenty occurrences and less than 3,000 individuals, or because of some factor(s), vulnerable to extinction.

G3– Very rare and local throughout its range or found locally in a restricted range, or, because of other factors, vulnerable to extinction throughout its range. Generally between 21 and 100 occurrences and fewer than 10,000 individuals.

G4– Apparently secure globally, though it may be quite rare in parts of its range, especially at the periphery. Thus, the plant is of long-term concern.

G5– Demonstrably secure globally, though it might be quite rare in parts of its range, especially at the periphery.

GH– Of historical occurrence throughout its range, i.e., formally part of the established biota, with the expectation that it may be rediscovered.

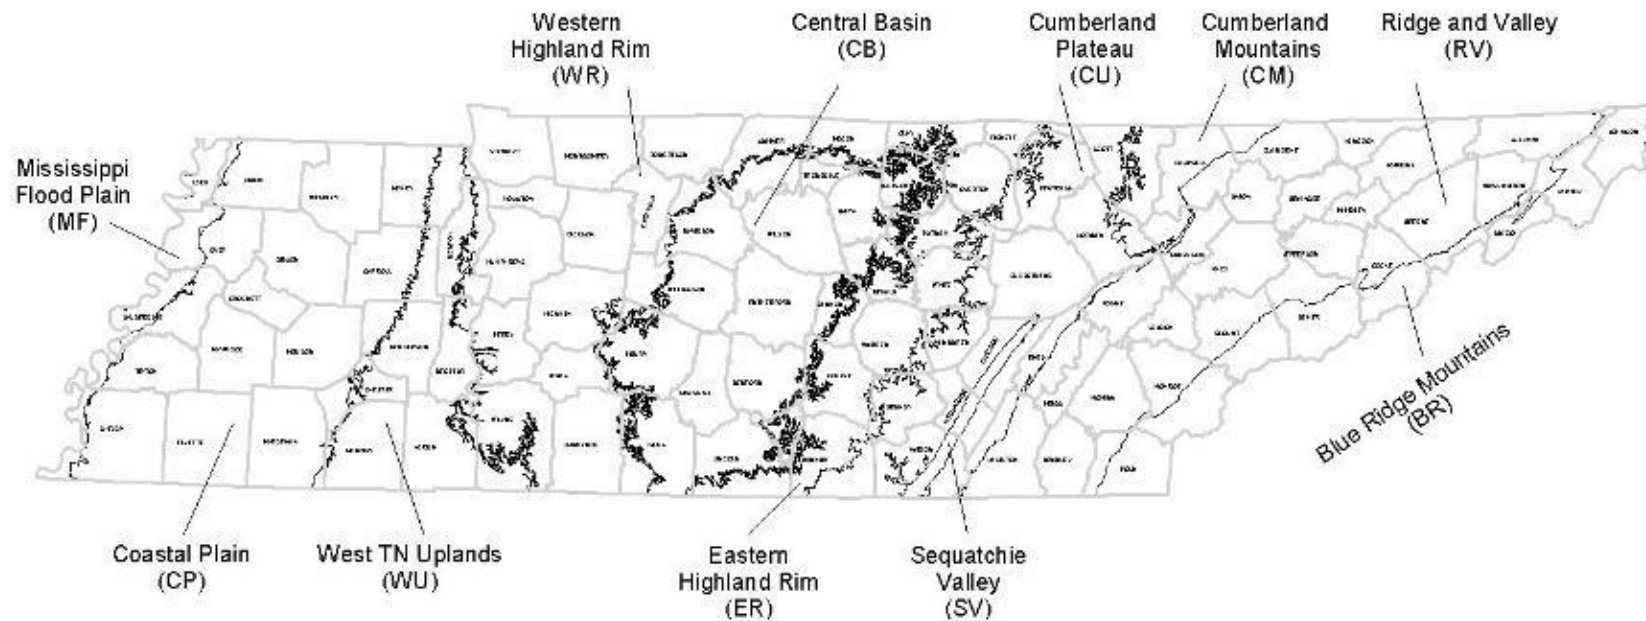

GNR– No assigned rank yet due to recent taxonomic issues.

GU– Possibly in peril range-wide but status uncertain, need more information.

GX– Believed to be extinct throughout its former range, with virtually no likelihood that it will be rediscovered.

G#Q– Taxonomic status is questionable, numeric rank may change with taxonomy.

G#?– Inexact numeric rank.

Physiographic Provinces of Tennessee
